Problem we are trying to solve

UCSD hosts a bunch of events every week ranging from career fairs to club meetings and even social gatherings. Despite the variety, many events experience low student attendance.

- Students often miss out because they aren't really aware of events that match their interests.
- Existing communications methods such as bulletin boards or instagram posts could be pretty overwhelming, disorganized or even easy to ignore.

There needs to something that allows for a more centralized, personalized, and engaging way for students to discover campus events.

How might we statement:

How might we make it easier and more engaging for students to discover campus events they care about?

Our Potential Solution

We propose building a Campus Event Recommender WebApp.

- A single platform that **gathers all campus events** into one organized space.
- Users can **swipe left/right** (similar to dating apps) to mark interest or skip events.
- **Personalized experience** based on user preferences.
- **Optional integration** with Google Calendar API for **easy event reminders and planning**.
- Clean, simple interface using **HTML, CSS, and Vanilla JavaScript**.

Why Does Your Idea Stand Out

- Platform allows for students to voice their opinions on campus events
- Provides feedback to event organizers on what students would like to see
- Allows for an easier overlook of how many students plan on attending and trends event organizers can follow over time

Who are we catering to?

- College students looking for social events and campus activities
- New students or freshmen that want to get involved on campus
- Students who are struggling to find events that are relevant to them and their interests
- Clubs and organizations wanting better event visibility
- Students who missed events because they weren't advertised well
- Students who feel overwhelmed by multiple campus event emails/posters
- Student leaders and event organizers who want better attendance
- Students looking for weekend or after class activities
- Busy students who want quick and easy access to event information

Our potential tools / resources

We can be using these possible tools / resources in order to build the application:

- HTML (for frontend development)
- CSS (for frontend styling)
- Javascript (for frontend functionality)
- Localstorage / IndexedDB / SQL or Postgres (for storing user data, preferences, and choices)
- Figma (for designing)
- Excalidraw (for potential wireframing)
- Github (for version control)
- Slack (for communication)

Possible Negatives (And How They Can be Avoided)

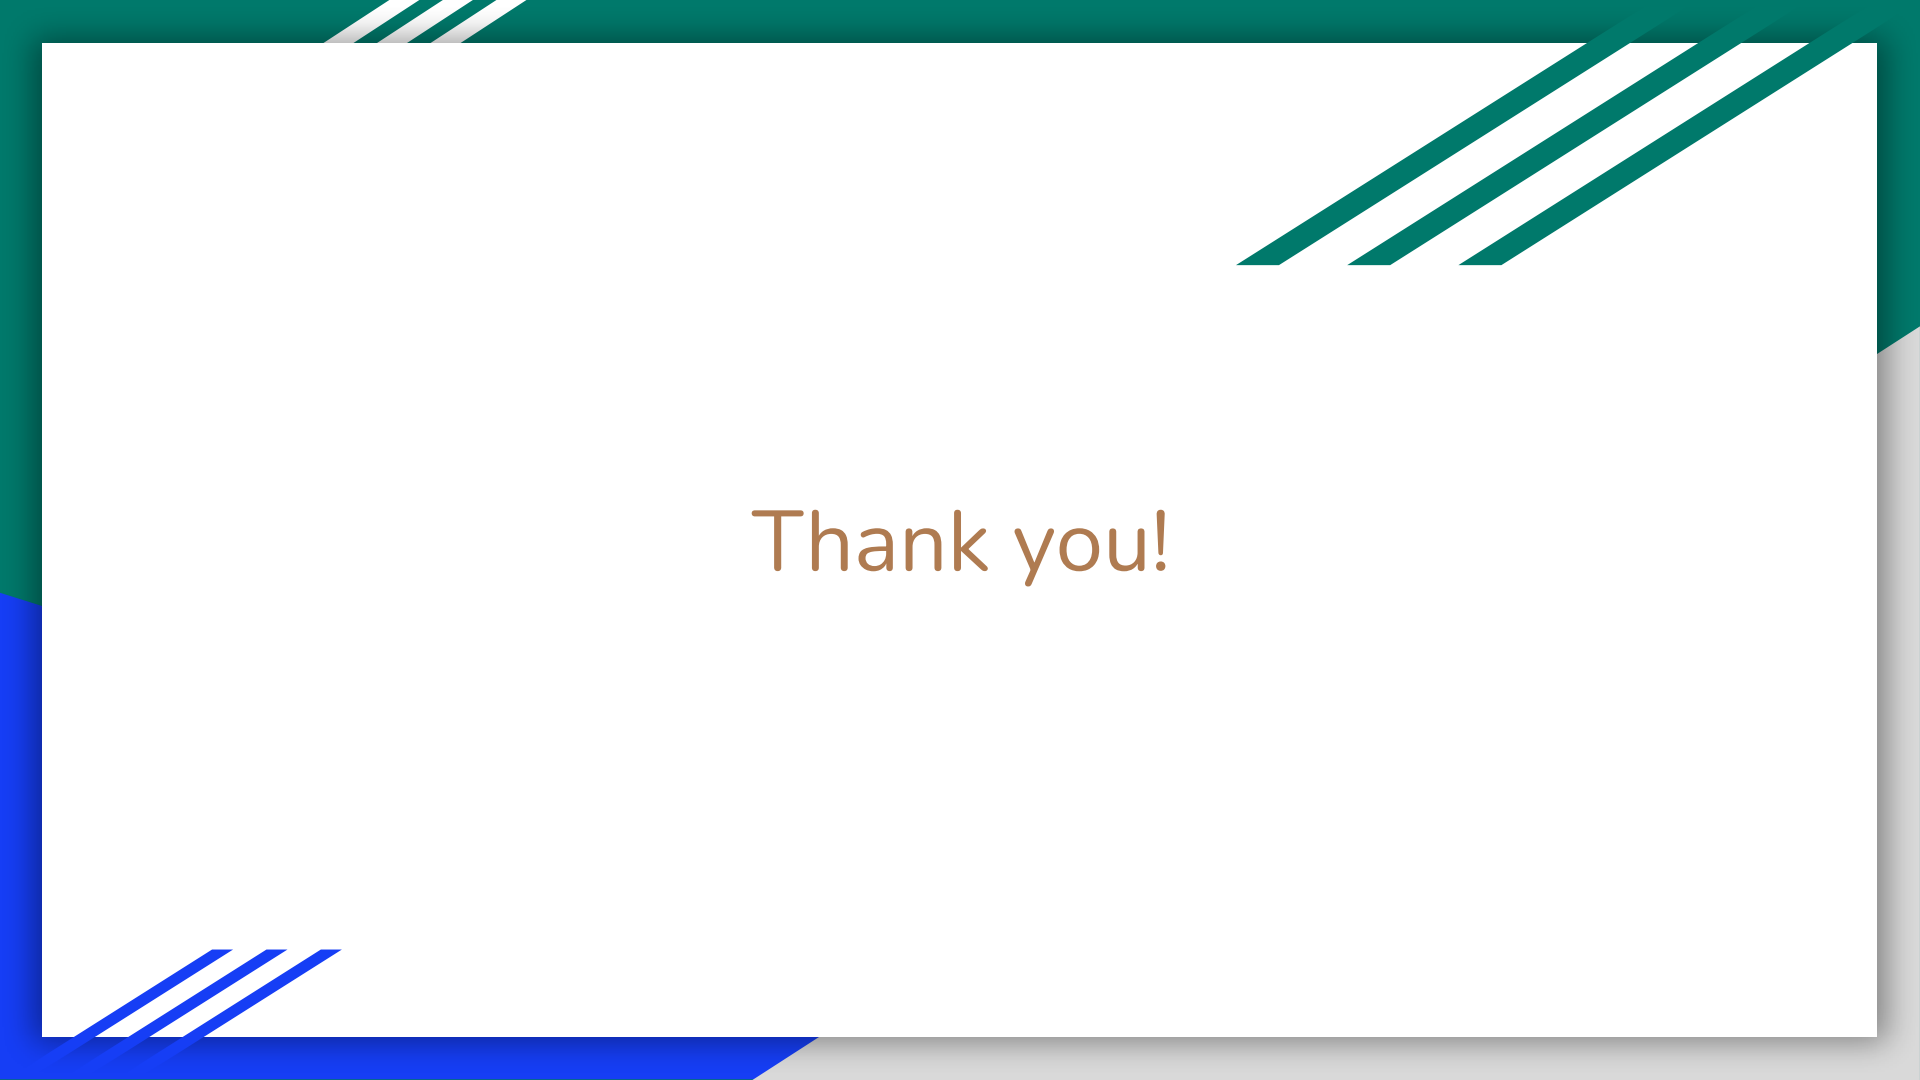

- Event overloading (Too many events) → Because a large number of events, students might feel overwhelmed given the amount of choices
 - Introduce limiting factors: Number of swipes, etc.
 - Introduce filters, allowing students to filter through the events so they only see what they're interested in
- Visibility dominance of larger events - Because of the popularity of larger and more famous events, other smaller ones might go by unnoticed
 - Build a better recommending algorithm that would give equal importance to every event
- Possible devaluation of certain events – Once used to, students might swipe too much too fast to even read the details about the event, lowering their value
 - We could introduce a “interested” feature that would remind the user to come back to a certain event

Preferred results

- For clubs:
 - Provide insights for which events “work” and are more popular
 - Exposure for different clubs outside of just social media
 - Events will reach the students that are most likely to be interested
- For students:
 - Discover new clubs and friends
 - Easier to keep track of the 10s of events going on each day
 - Nicer interface than tracking the AS fundings
 - More interconnected campus (no more UC Socially Dead :))
 - Find opportunities to get free food and merch from events

End Goal

- Create an application that allows for students to have more exposure to events held by campus organizations
 - Organized manner of presenting an abundance of information that would otherwise be a hassle to find
 - Allows for more exposure from clubs/organizations and allows for increased student body engagement
 - Alternative method to meeting new friends
- Allow for event hosts to receive feedback on events due to student engagement (Swiping left or right)

Thank you!
